"Structure of monomeric porcine DesRI-B2 despentapeptide (H26-B30) insulin at 1.65 a resolution."

*Structure of monomeric porcine DesRI-B2 despentapeptide (H26-B30) insulin at 1.65 a resolution.

**Tructure of monomeric porcine DesRI-B2 despentation of the Crystalogr. DesRI-B3 (H27).

**Increases cell permeability to Monosaccharibes, amino Avid. AND FATTY Acids. If Accelerates Givcolvsis, THE PENTOSE PHOSPHATE CYCLE, AND GLYCOGEN SYNTHESIS IN LIVER.

**Increases cell permeability of a B CHAIN AND AN A CHAIN LINKED BY INC. DISULFIDE BONDS.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. SUMMARIES

AAY42860;

19-JAN-2000 (first entry)

hGH-mini-proinsulin chimeric protein.

Insulin; precursor; growth hormone; chaperone; intramolecular; folding; conformation; chimeric protein; cleavable; recombinant; production; yield.

Synthetic. Homo sapiens.

                                            This sequence represents a chimeric protein, hGH-mini-proinsulin.
This chimeric protein contains an N-terminal fragment of human growth hormone (hGH) of the sequence given in AAV42855, a cleavable peptide
Linker (AAY42857), and a human insulin precursor comprising insulin
A and B chains (AAX42859). The hGH portion of the chimeric protein acts as an intramolecular chaperone (IMC) for the insulin precursor, canabing it to fold correctly. The cleavable peptide linker has a C-terminal Arg residue which enables the hGH portion of the chimeric protein to be removed after folding has taken place. Production of the combinant human insulin via an hGH-profusulin chimeric protein can provide human insulin with correctly linked cysteine bridges with fewer necessary procedural steps, and hence resulting in a higher yield of human insulin The IMC sequences not only protect insulin sequences from intracellular degradation by a microorganism host, but also promote the folding of the fused insulin precursor, facilitate the solubility of the fusion protein and decrease the intermolecular interactions among
                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                              the fusion proteins, thus allowing folding of the fused insulin precursor at commercially useful high concentrations. The procedural steps of cyanogen bromide cleavage, oxidative sulphitolysis and related

This sequence represents a chimeric protein, which contains an N-terminal fragment of human growth hormone (hGH) of the sequence given in AAY42856, a cleavable petide linker (AAY42857), and a human insulin precursor comprisaing it to fold correctly. The hGH nortion of the chimeric protein acts as an intramolecular chaperone (lMC) for the chimeric protein acts as an intramolecular chaperone (lMC) for the chimeric protein to be removed after folding has taken place. Production of recombinant human insulin vith correctly linked cystoine bridges with fewer necessary procedural steps, and hence resulting in a higher protein can provide human insulin with correctly linked cystoine bridges with fewer necessary procedural steps, and hence resulting in a higher promote the folding of the fused insulin precursor, facilitate the solubility of the fusion protein and decrease the intermolecular interactions among the fusion proteins, thus allowing folding of the fusion proteins, thus allowing folding of the commercially useful high concentrations. The procedural steps of cyanogen bromide cleavage, oxidative sulphifoldysis and related purification steps can thus be eliminated, along with the use of hydrophobic absorbent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A new method for the production of recombinant human insulin comprises folding a hybrid polypeptide comprising proinsulin under conditions that permit correct disulphide bond formation and subjecting that folded protein to enzymatic cleavage. The insulin produced can then be purified. This sequence is a SOD-insulin B chain-Lys-Arg-insulin A chain hybrid polypeptide and is encoded by the plasmid construct pBAST-R. Transformation of the proper E.coli
                                                                                                       with a mercaptor to provide 2-10 SH residues per Cys residue. In presence of a chaotropic agent and in aq. medium of pH 10-1; treating the proj. with 3-59 g hydrophobic adsorber residue per i admedium of pH 47, isolating the adsorbed resin and pro-insulin and desorbing the pro-insulin. This method produces pro-insulin with correctly bonded Cys bridges. Compared with known methods it involves fewer stages (esp. no sulphitolysis or cyanogen bromide cleavage) and overall losses during purification are reduced, i.e. the process is quicker and gives better yields. Sequences of insulin chain A, B and C are given in AAK68895-97. Sequences of pro-insulin 1-4 are given in AAK68898-01. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Recombinant insulin prodn. by correctly folding pro-insulin hybrid polypeptide - then enzymatic cleavage of folded product, does not require sulphite protection of SH nor use of cyanogen bromide
                                                                                           Pro-insulin is produced by treating recombinant precursor protein

                                                                Recombinant insulin prodm. by correctly tolding pro-insulin hybrid polypeptide - then enzymatic cleavage of folded product, does not require sulphite protection of SH nor use of cyanogen bromide
                                                                                                                                                                                                                        comprises folding a hybrid polypeptide comprising proinsulin under conditions that permit correct dissulphide bond formation and subjecting that folded protein to enzymetic cleavage. The insulin produced can then be purified. This sequence is a SOD-insulin broduced can then be purified. This sequence is a SOD-insulin broduced can then be purified. This sequence is a SOD-insulin by the plasmid construct pDBAST-LAT. Transformation of the proper E.coli host cells with pDBAST-LAT results in the efficient expression of the proinsulin hybrid polypeptido. Mestal for human insulin production. The method produces recombinant human insulin identical to the natural hormone. Hazardous and cumbersome
                                                                                                                                                                                                                                                                                                                                                                                                                                                   procedures involving cyanogen bromide and sulphitolysis to protect SH groups are avoided since the entire hybrid polypeptide folds efficiently to the native structure even with the leader attached
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Prodm. of pro-insulin with correct dissulphide bridges - by treating recombinant precursor protein with mercaptan in alkali and in presence of chaotropic agent, then isolation on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DB 17; Length 116;
                                                                                                                                                                                                     A new method for the production of recombinant human insulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pro-insulin: A-chain: B chain; C-chain; disulphide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sabel W;
                                                                                                                                                         Example 18; Figure 7; 69pp; English.
